1. Introduction

The Black Fortress project is a secure authentication and authorization system designed to provide role-based access control (RBAC) for web applications. It ensures safe user login, protects against unauthorized access, and provides an admin panel for user management.

2. Key Features

- Secure User Registration & Login with password hashing (bcrypt)
- Role-Based Access Control (RBAC) with admin and user roles
- Admin Dashboard to manage users and update roles
- Security Enhancements: Helmet CSP, CORS, rate limiting, account lockouts
- Input Validation & Sanitization using express-validator
- Google reCAPTCHA v3 Integration (optional, to prevent bots)
- Frontend UI with login, registration, user dashboard, and admin dashboard pages

3. Technology Stack

- Backend: Node.js, Express.js
- Database: MongoDB with Mongoose
- Authentication: JWT (HttpOnly cookies), bcrypt
- Frontend: HTML, CSS, Vanilla JavaScript
- Security Middleware: Helmet, CORS, express-rate-limit
- Deployment: Render
- Optional: Google reCAPTCHA v3

4. System Workflow

1. User registers → credentials validated and stored securely
2. User logs in → JWT issued and stored in HttpOnly cookie
3. Access granted based on role:
 - User: Can access user dashboard only
 - Admin: Can manage users, assign/remove roles
4. Logout clears session cookies

5. Project Structure

7. Deployment Instructions

1. Clone the repository
2. Run npm install
3. Configure .env file with:
4. PORT=5000
5. NODE_ENV=production
6. JWT_SECRET=yourSecretKey
7. MONGO_URI=yourMongoConnectionString
8. RECAPTCHA_SITE_KEY=optional
9. RECAPTCHA_SECRET=optional
10. Start server: node src/server.js
11. Open in browser: http://localhost:5000

8. Conclusion

The Black Fortress project delivers a secure, modular authentication system with role-based access control. It emphasizes security, scalability, and usability, making it suitable for integration into production-grade applications.
